Here are the instructions for getting into Oracle:

1. Make sure Microsoft Remote Desktop is installed (If you're on Mac, there's an app on the app store called "Microsoft Remote Desktop").
2. Open Microsoft Remote Desktop and locate where to type in the name of your virtual machine (On Mac you have to click the plus button in the upper left corner next to settings and click "Add PC").
3. Go to canvas and find CS 3520. Go to files. In files there is a file called "VM Accounts Fall 2020.txt" which contains the name of the virtual machine assigned to you. It should begin with "CS3520-001-...".
4. In Microsoft Remote Desktop, type in the name of the virtual machine assigned to you in the box you located in step 2.
5. When the login box opens to get into your virtual machine, type in your UVU credentials (some people have to type in ad\ in front of their UVUID).
6. Once you get logged into your VM, you have to install Oracle. Go to file explorer, and go to Local Disk (C:) -> Software Installation -> OracleXE112_Win64->DISK1 and double click the "setup" file.
7. Follow the installation steps, and eventually Oracle will prompt you for a password. Create your own password (I just used my UVU password).
8. Oracle should then install. Once it is finished installing, open it, and click on "Application Express"
9. At this point it should prompt you for a username and password. Type in "system" for the username, and use the password you set up in step 7 for the password. (If that doesn't work, try your UVU password).
10. At that point, you should be able to create a workspace. The workspace is what you need to complete assignment 3. When it asks you for the workspace name, it is asking for whatever you typed in the "Database Username" box.
